

TRICARE Data Quality Training Course

August 2012

What is DHSS?

40,000 Foot View

- DHSS is an Office for the Military Health System that builds or maintains products in three major areas: Clinical Support, Medical logistics, and Resources.
- Supports TRICARE decision making that makes the vision of the Military Health System Plan possible
- It is the Military Health System technology that integrates and standardizes clinical, resource, population, logistics, and other referential information

DHSS Supports Enterprise-Wide Data Quality Efforts

What is DHSS?

- DHSS operates MHS's centralized data store
- Receive, analyze, process, and store 100+ terabytes of data
- Thousands of users worldwide
- DHSS Systems Include:
 - MDR being the "Feeder" for "DATA N"

Objective

- Why data quality matters for DHSS
- How DHSS's tools affect the data and quality of data used in decision making
- How you can use DHSS information in your data quality program

Clinical Support	Medical Logistics	Resources
CCQAS M2 MDR NMIS PSR SNPMIS TOL	CUD DCAM DMLSS DOEHRHS-UC DOEHRHS-IL ESSENCE JMAR PMITS TEWLS	CCE DMHRsi EAS IV MHS Learn PEPR PHIMT TED TPOCS

What is DHSS?

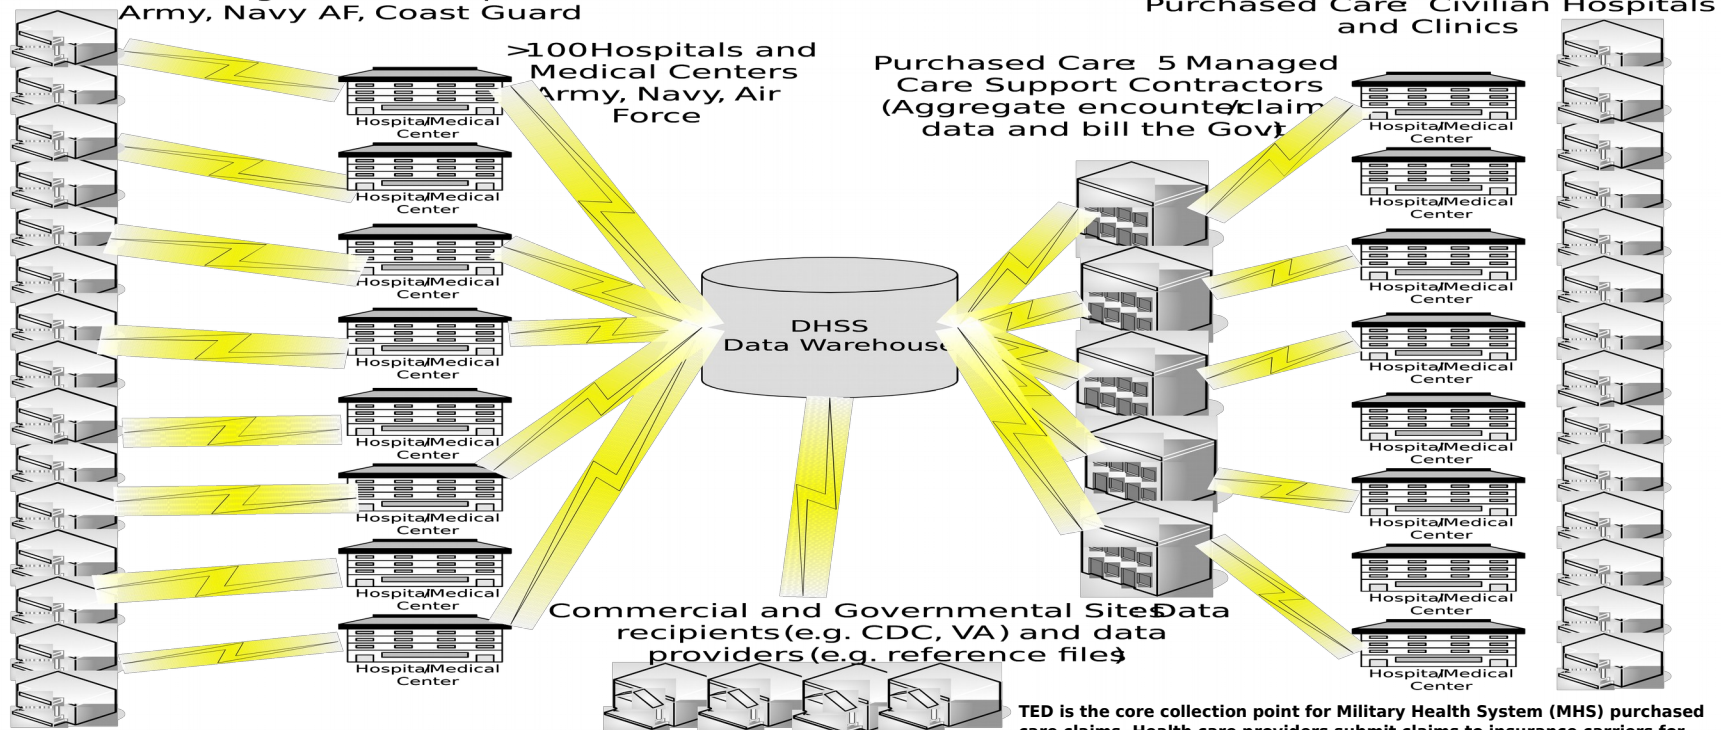

20,000 Foot View

>460 Freestanding Medical (Outpatient) Clinics
Army, Navy AF, Coast Guard

>100 Hospitals and Medical Centers
Army, Navy, Air Force

Purchased Care Civilian Hospitals and Clinics

Purchased Care 5 Managed Care Support Contractors (Aggregate encounter/claim data and bill the Govt)

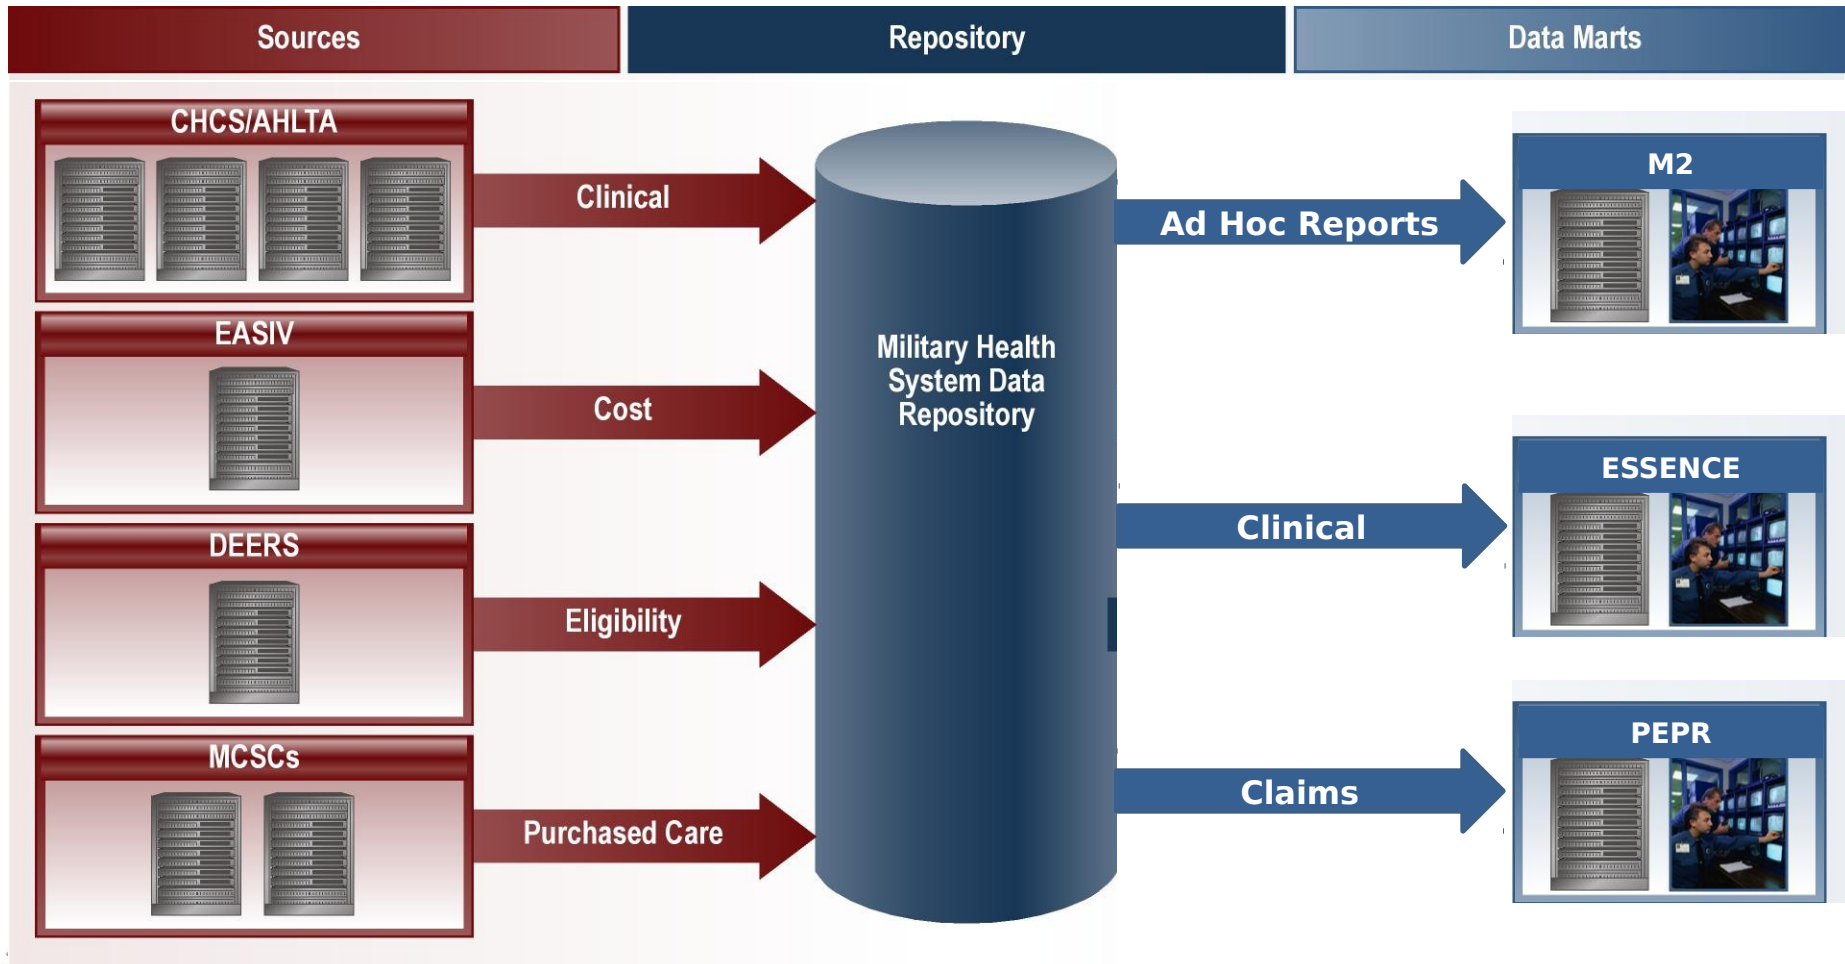

TED is the core collection point for Military Health System (MHS) purchased care claims. Health care providers submit claims to insurance carriers for payments of services rendered to TRICARE beneficiaries. The carriers then electronically transmit their claims payment information to TRICARE, using TED.

Circa 10 Million Beneficiaries		
Direct (Military Provided) Care:	Inpatient: 250,000 Annually	Outpatient: 30 Million Annually
Purchased (Civilian Provided) Care	Inpatient Claims: 800,000 Annually	Outpatient "Claims": 100 Million Annually

DHSS Architecture

5,000 Foot View

- **A wide variety of healthcare data**

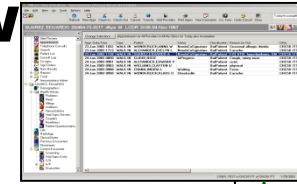

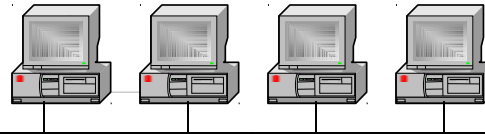

- **Collects and distributes data**

-
- Conceptual Diagram - The Data Warehouse and Data Marts**
- This diagram illustrates the data flow in a data warehouse and data marts architecture. The process begins with **Raw Data** entering the **Warehouse Generation Software**. The **Metadata Repository** provides input to the software. The software feeds into the **Operational Data Store**, which is described as "Is the single point for data integration, data quality edits and healthcare data transfers". The **Operational Data Store** then feeds into the **Data Warehouse**, which is also described as "Is the single point for data integration, data quality edits and healthcare data transfers". The **Data Warehouse** feeds into **Data Marts**. The **Data Marts** then feed into **Query and Reporting Tools**. The **Metadata Repository** also provides input to the **Data Warehouse**. The **Data Marts** provide input to the **Query and Reporting Tools**. The diagram is captioned **It all starts with healthy data**.
- ```
graph TD; RawData[Raw Data] --> WGS[Warehouse Generation Software]; MR[Metadata Repository] --> WGS; WGS --> ODS((Operational Data Store)); ODS --> DW((Data Warehouse)); MR --> DW; ODS --> QRT[Query and Reporting Tools]; DW --> DM((Data Marts)); DM --> QRT;
```
- Raw Data**
- Warehouse Generation Software**
- Operational Data Store**
- Data Warehouse**
- Data Marts**
- Query and Reporting Tools**
- Metadata Repository**
- Is the single point for data integration, data quality edits and healthcare data transfers
- Is the single point for data integration, data quality edits and healthcare data transfers
- It all starts with healthy data*

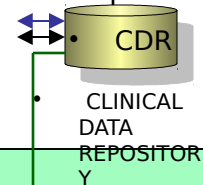

## ELIGIBILITY & ENROLLMENT

## APPOINTMENTS

## ANCILLARY CCPR Extracts

## GCPR Extracts

### HL and CADBE

- **SIT/OHI and CADRE**

# MDR (MHS Data Repository)

**Centralized data capture and validation of MHS data worldwide**

**More than 5 billion records on-line with 10+ years of data**

**Provides repository for other systems & applications to receive extracts**

**Typical users: small cadre of high-level data analysts**

**The Military Health System Data Repository [MDR] is the centralized data repository that captures, validates and distributes health network data worldwide.**

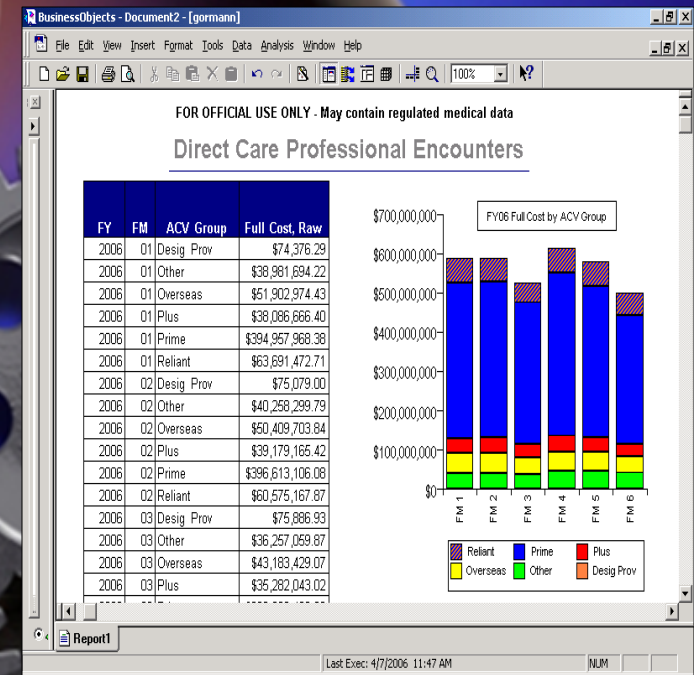

**It is the single point for data integration, data quality edits, online and nearline data storage and healthcare data transfers.**

**Preserves historical “raw” data by type and by year and normalizes/processes data against specific business rules.**

**Serves as the single point for data integration, data quality edits and healthcare data transfers**

# M2 (MHS Management Analysis & Reporting Tool)

- Powerful ad hoc query tool for detailed trend analysis such as patient and provider profiling
- Typical users: Data analysts skilled in Business Objects software

# DHSS Data Quality Requirements

- Capture and catalog data files
- Assess and monitor data completeness
- Perform data quality assessments (basic validity checks)
- Develop and maintain data quality software that:
  - Performs automatic data quality checks
  - Implements data quality assessments
  - Provides metrics and manages perspective of the files' data quality

# DHSS Data Quality Metrics Address:

- Integrity: is it secure?
- Relevancy: is it appropriate?
  - Reliability: is it rationally correlated? (e.g. CAPER vs Appts vs SADR)
  - Validity: is it sound? (e.g. not from TEST MEPRS codes, does it represent a valid encounter)
- Consistency: is it free from contradiction?
  - Uniqueness: is it free from duplication?
- Timeliness: is it available when needed?
  - E.g. What are the lag times from encounter to visibility in datamarts?
- Completeness: is it whole?
  - e.g. truncated/aberrant/malformed

Accuracy: is it free from error?

• “Functional” analysis and ingest business

# DHSS's Data Quality Tools

- A **Real-time/Run-time** data quality/completeness database for:
  - SIDR SADR CAPER HL7 PDTS Appointment Ancillary CADRE SIT/OHI Other Data Types
- Database updated daily and scripted to provide “**event-driven**” alerts via e-mail for critical data quality issues or problems
- For DMIS ID's, “real time” and “snapshot” views of key data completeness measures
- Internal access for standard “canned” Data Quality/Completeness reports
- Multilayer data comparisons from raw to processed data for procedure-based actions
- **Multilayer comparisons** of related data types (e.g. SADR vs CAPER vs Appt vs WWR vs MEPRS)

• **Statistical process control algorithms and control charts to detect data anomalies**

# DHSS's "Data Tracker"

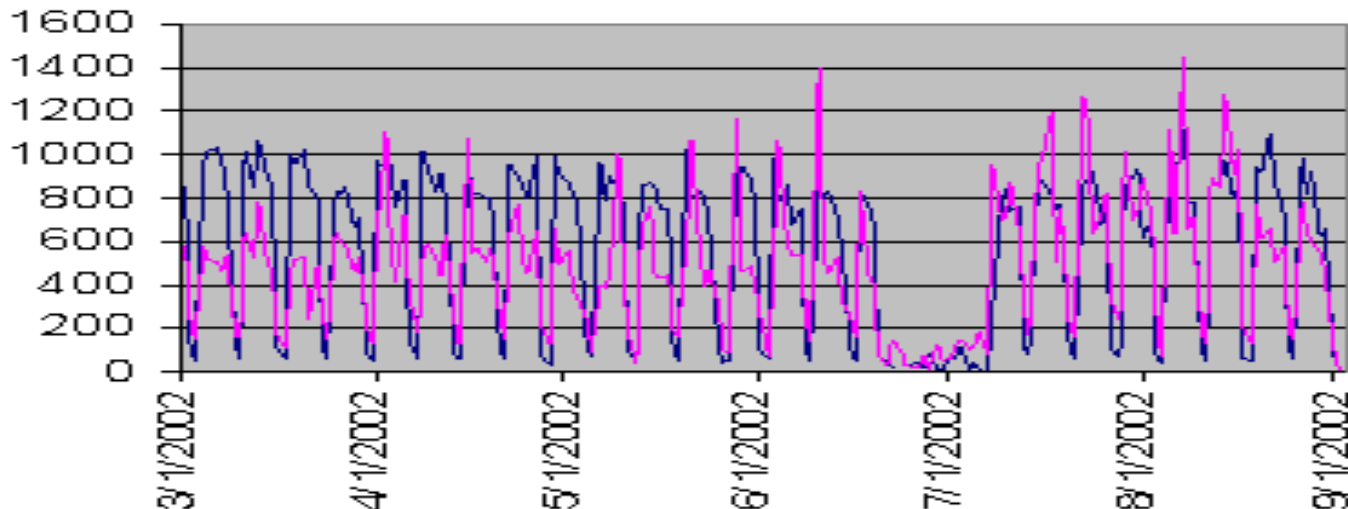

- **Essentially a "Mini MDR/M2". Data processed in real time**
- **Data Tracker tools and reports**
  - **SIDR, CAPER, HL7, Appointment, Ancillary, CADRE, SIT/OHI, TED Inst/Non-Inst reports provide:**
    - File based accounting (e.g. Gap reports)
    - Treatment based accounting (e.g. reports based on care date)
    - Timeliness reporting (e.g. lag from care rendered date to ingest)
    - Other statistical reports including benchmarking against WWR
    - Statistical Process Control Alerting for SADR/CAPER anomalies
  - **Other Data Tracker tools and reports**
    - Monthly reports (SIDR and SADR/CAPER vs. WWR and Appointments - "Benchmarking")
    - Ad Hoc Queries to the Data Tracker
    - Gap Reports - Receipt Reports - Pull Reports
  - **Current Data Tracker reports on the DHSS Web site**
    - Daily SADR by HOST DMIS (The *"What Was Received Yesterday"* Report)
    - Daily SADR by Treatment ID - 90 Day (The daily *"90 Day Roller"* Report)
    - Monthly SIDR by Treatment DMIS
    - Weekly HL7 Gaps

# Basic Data Quality Assurance Tools

- **Start with Run Charts**

Example of facilities showing gaps in daily outpatient encounter data receipt. Investigation and data recovery actions required.

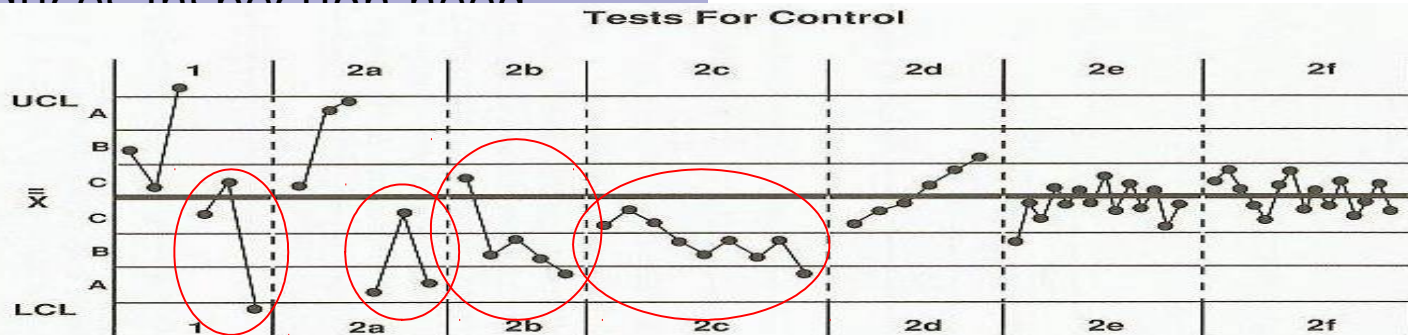

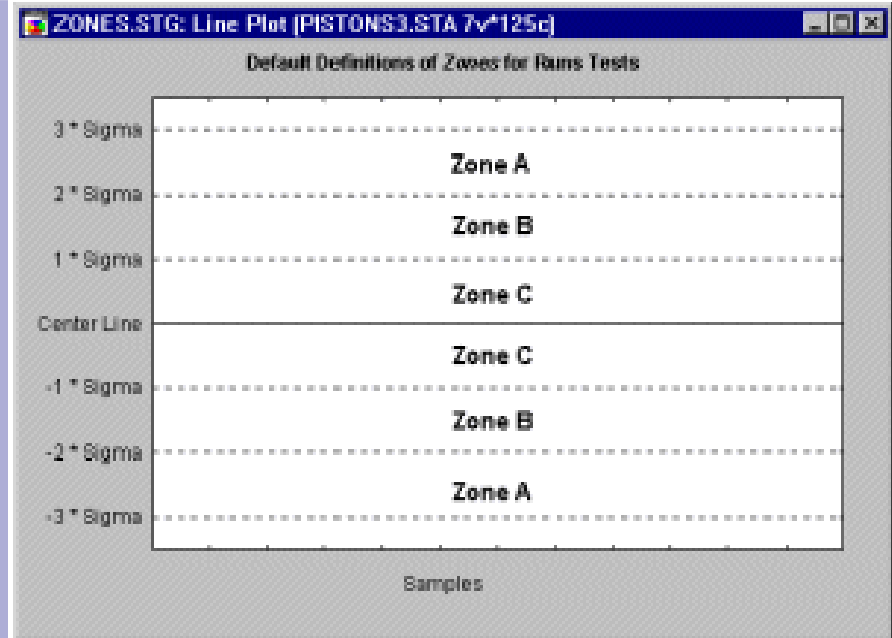

*Data set has no correlation with other source system provided data*

# Data Completeness Determination

## “Completeness” as a Process Control Problem

- Amenable to Statistical\Process Control
- Examine for Special Cause Variation
- Signals when a problem has occurred
- Detects variation
- Allows “Process Characterization”
- Reduces inspection need

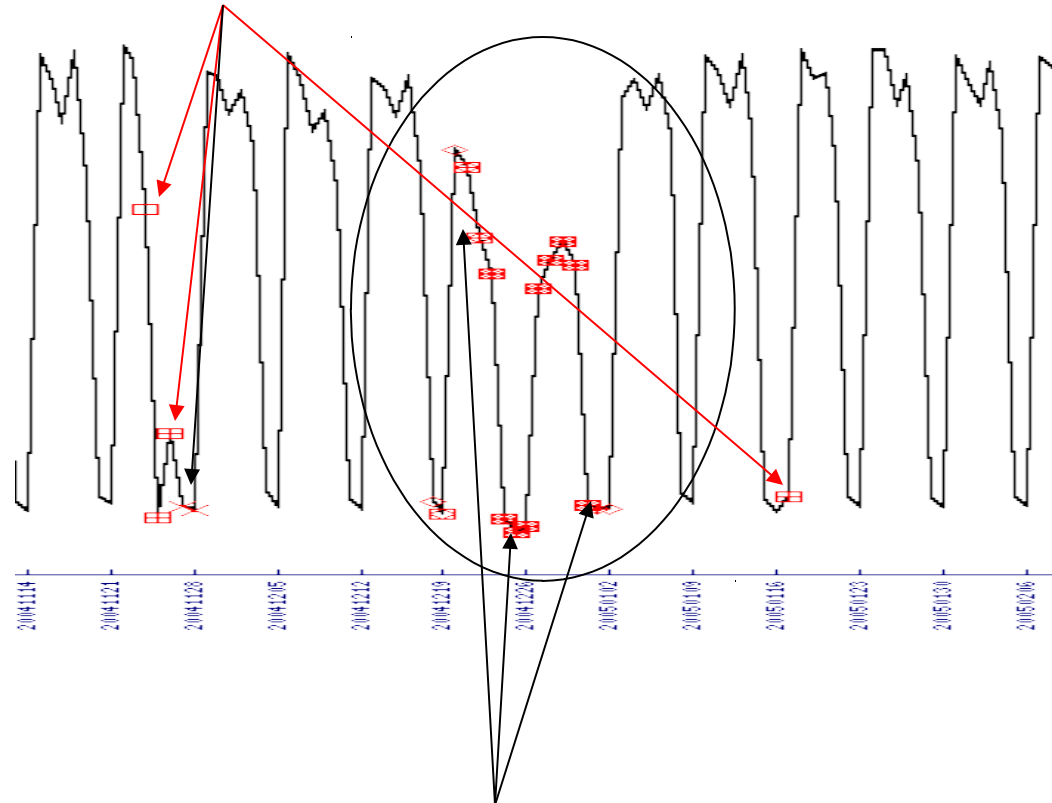

# Compare Each Day To Itself

DMIS ID

Project previous data to today then compare this projection with newly arrived data.

- Red Boxes/X's/etc indicate "Alerts" sent to DQ Team via automated email

- **Holiday Logic Pending**

• Chart: *Encounters by Day*

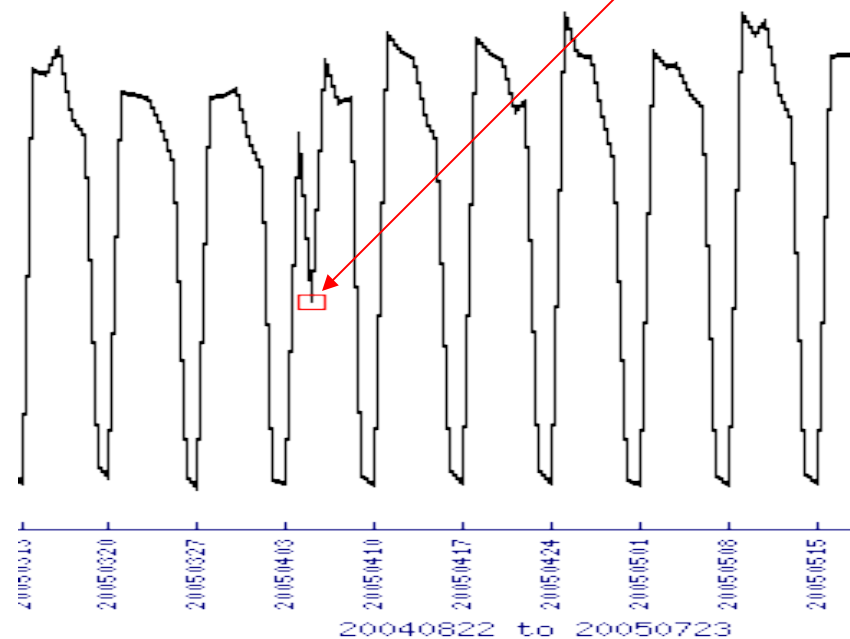

# Identifying Data Completeness Problems

- Red boxes/Xs/etc. indicate automatic e-mail “Alerts” to the data quality team.

## Alerting and Notification Issue

How do you identify and present “possible” problems when:

- the “problem” is transient,
- it is one data point in a series,
- it is from one of a vast number of daily input data sources?

- *Essentially a projection of previous data forward in time to today then a comparison of this projection with the newly arrived data.*

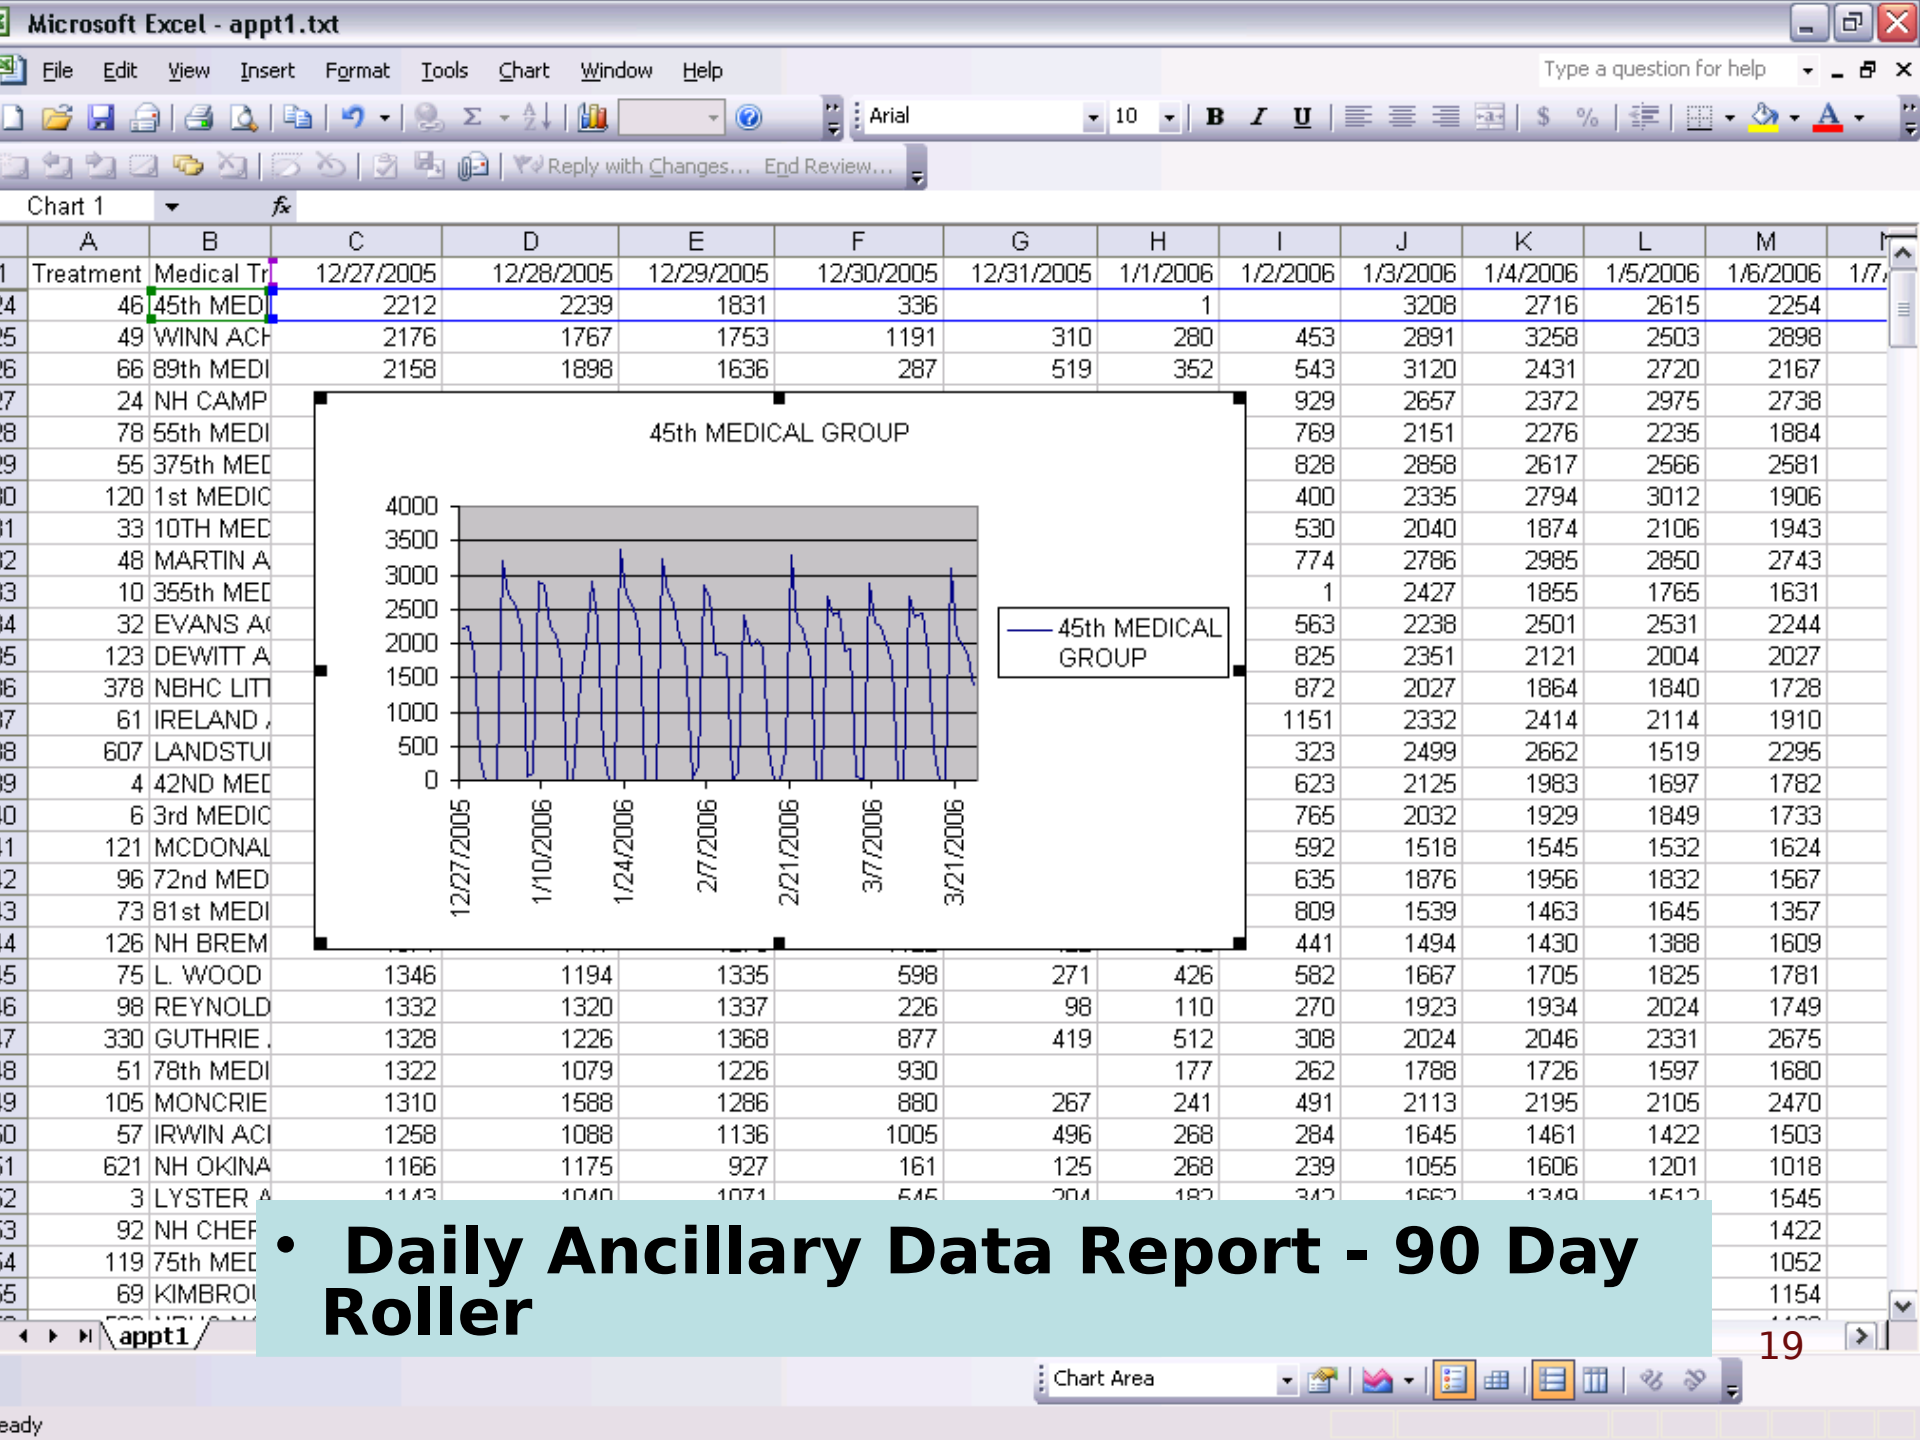

# Report: CAPER vs Appointment vs WWR vs MEPRS

Site has the most encounters for the time frame. They do well on this metric compared to other large facilities. [Relatively low mean AND standard deviation, recall that 1.0 is the "lowest" obtainable mean, and 2.0 (2 days from encounter to receipt) a more realistic expectation]

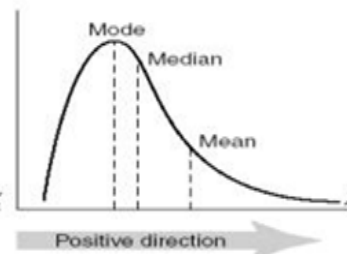

What do THEY do, that the others do not? Why is their Standard Deviation more "Bell Curve" like than others?

(b) Normal (no skew)

Since greater Standard Deviation = 's more "Variation", some locations or other factors within the facility must do much better than others.

(c) Positively skewed

- Standard Deviation is worse than
- High Mean - High Standard Deviation
- Why?
- Low Std Dev means MOST records come in near the mean.
- High Std Dev means (in this example) relatively few records skew

List of Problem Facilities - AUTOMATED IDENTIFICATION USING STATISTICAL PROCESS CONTROL ALGORITHMS

Human Interpretation: 2 files after one day gap and volume appears consistent with prior "same days"

STATISTICAL PROCESS CONTROL - Determines that volume for X days is NOT consistent with prior data

SPC AND File Absence Alerting

# Data Quality Processes

**Problem Resolution Process : IF “file level” OR “encounter date level” problem detected:**

- Immediate MHS Help Desk Ticket
- Notification if problem is deemed “significant and or long standing”
- Determination if “Blaster” message to analytical community is appropriate or required. Note that individual site “transient” halts in transmission occur regularly and are usually resolved quickly. These “transient” problems are not reported in real time as M2 utilizes a batch process and problems are often resolved between batch processing cycles.
- Coordination with “Service POCs” to determine if problem also exists in “Service” databases.
- Recovery of files via sharing between service databases and DHSS
- Tier III recovery/reharvest of missing data (except HL7 and Ancillary as no reharvest mechanism exists)

# Data Quality Processes

## Common Problems - In Order of Occurrence

### Four Broad Categories:

- Provider/Coding Issues
  - “Slow Coding” from the data receipt perspective (as compared to other like facilities)
  - Provider “left”
- Transmission/Send of Data
  - Sy-ETU Problems
  - Host Issues (e.g. Change Package induced problems)
- Network Routing Issues
- Ingest or Processing (e.g. DHSS downtime - very rare)

# DHSS's Tools Improve MHS Data Quality

## **And allow DHSS to:**

Catalog data files

Monitor data completeness

Provide metrics to assess data quality/completeness of data received

Design, develop and maintain data quality software

# The Key To Data Quality Success

- Partnering with our users to maximize information sharing
- Questions?
